

## **SECTION - 8**

### **CONCLUSIONS**

Conclusively, the installation of Coca-Cola Plant will be beneficial for economic growth and to improve the life style of the locals. The underlying goal of proposed action is to fulfill the demand of coke products in Federal capital, KPK and northern areas of the country. The landuse is compatible as it is close to industrial estate. The proposed action will have potential positive impacts on the physical and socioeconomic environment by saving the consumption of fuel and provision of jobs and business opportunities to local and transitive workforce both at construction and operation phase. Potential adverse impacts are anticipated to occur at the construction stage including deterioration of air quality, noise and removal of vegetation which can be mitigated by applying Best Management Practices (BMPs)/Best Engineering Practices (BEPs). At operation stage the extraction of ground water will have potential negative impact; however, the wastewater generated from the operation will be treated and its discharge to tributary of Harrow River will recharge the aquifer. The underlying aquifer has the capacity for recharge. EMMP should be the part of the contract document and should be thoroughly implemented. A critical element will be the sustained involvement of all stakeholders during the construction and operation of the project for its timely completion and successful functioning.

Results of EIA Study have shown that the impacts of the proposed project activity on the physical and biological environment will be negligible. The proposed project will have a positive and healthy improvement in socio-economic environment of the proposed area.
